Hiring Team at Reddit,

I can help Community Builders turn complex product problems into clear, reliable experiences by shipping user-facing features end to end, improving performance, and aligning Product, Design, and Engineering from early decisions through launch.

At GasHub, I delivered a real-time React trading-platform prototype in under three weeks, then built a virtualized interface for large datasets. Three rounds of profiling reduced initial React mount time by 97% and per-block data-load commits by 94%.

I also improve team execution beyond individual components. I created a shared Pencil.dev workflow, reduced Products API warm latency by 95.7% to approximately 132 ms, established Testing Library and Playwright coverage, and documented architecture and business rules for onboarding.

Earlier, I modernized a business-critical AngularJS payment system, implemented W3C accessibility standards, and established CI/CD quality practices. I hold a Bachelor's degree in Computer Science and bring an evidence-based approach to frontend architecture, inclusive UX, and collaborative delivery.

I would welcome the opportunity to help Reddit make community-building experiences more reliable and rewarding while strengthening the team's engineering practices. Thank you for your consideration.

Sincerely, Danilo Santos
