Dear Hiring Team,

I'm excited to apply for the **Senior Frontend Engineer** position at 1950Labs. I'm a frontend engineer with over **seven years** of experience building scalable web products — most recently shipping a real-time trading platform and improving its performance end to end. My core stack lines up closely with what you're looking for: **React**, **Next.js**, **TypeScript**, **TailwindCSS**, **DrizzleORM**, **Zod**, and **PostgreSQL**.

At **GasHub**, I delivered a working prototype for a natural gas trading platform in under **three weeks**, giving the team something real to put in front of users. After that, I stayed focused on making it production-grade. I resolved a critical rendering bottleneck through profiler analysis — reducing initial page load from **59ms to under 2ms (-97%)**. I also diagnosed and fixed a slow API that was blocking the core user experience, cutting Products API latency from **3,010ms to 132ms (-95.7%)**. On the data side, I built the product browsing experience with **5 independently-filtered blocks**, infinite scroll, and **TanStack Virtual** row virtualization so the UI stayed responsive as datasets grew. On the backend, I led a migration to **Drizzle ORM** on Deno, introducing **Zod** validation and a layered architecture with proper transaction boundaries.

Before GasHub, I spent three years at **MyTime** building and modernizing their scheduling and POS platform in **Angular/TypeScript** — rebuilding core payment flows, implementing **NgRx** state management for complex multi-step operations, and establishing a test suite that gave the team confidence to keep shipping. Earlier, I built energy analytics dashboards and real-time data tools that non-technical users could actually navigate, and launched a serverless PDF generation service on **AWS Lambda**.

What attracts me to 1950Labs is the combination of operational complexity and product craft. I enjoy working on platforms where the data is dense and the UX requirements are demanding — and where the engineering decisions directly affect how useful the product is. I work well autonomously, communicate clearly across product and design, and care about building things that hold up over time.

Thank you for considering my application. I'd love to talk about what you're building and how I can contribute.

Best regards, Danilo Santos
