Hiring Team at Make,

I am applying for the Frontend Engineer (Freelance) position because Make's combination of AI-first engineering, product ownership, and practical focus on end-user outcomes matches how I build software.

At GasHub, I helped build a real-time natural gas trading platform from an early concept into a working prototype in under three weeks. I used React and AI-assisted development to move quickly through complex workflows, while keeping the implementation maintainable and testable. I then designed a data-rich trading interface with independently filtered blocks, infinite scrolling, and virtualization for large datasets. Profiling the result led to a 97% reduction in initial React mount time and a 94% reduction in per-block commit time.

I also take ownership across system boundaries when that is what the product requires. At GasHub, I reduced a critical Products API bottleneck by 95.7% through request profiling, query parallelization, transaction consolidation, and PostgreSQL analysis. I established Testing Library and Playwright coverage and helped modernize the backend architecture with TypeScript, Deno, Drizzle ORM, and a layered design. Earlier, I architected a browser-based desktop environment from scratch and led production AngularJS-to-Angular migrations without disrupting users.

These experiences have shaped a working style centered on clear communication, early risk identification, and evidence-based technical decisions. AI tools are valuable to me as force multipliers for exploration, implementation, debugging, and documentation, but I validate their output through tests, profiling, and review. That balance is especially important when building reliable software for real users.

I would welcome the opportunity to contribute to Make's remote engineering team and help deliver a high-quality data-rich web experience. Thank you for your consideration.

Sincerely,
Danilo Santos
